

From first notice to closed claim.

A live, working claims pipeline — claimant to adjuster to supervisor,
with the authority gate, the visibility wall, and the audit trail enforcing every step.

0 — outbox
Decision emails lost

This deck is a show-script: each page is a 2-minute live demo beat.
Run it with `npm run demo:seed`, then follow the red DEMO cues.

CONFIDENTIAL • Prepared for carrier evaluation

One claim, one pipeline, zero spreadsheets

Every claim walks the same enforced path. No side channels, no email-and-hope.

The three guarantees (say these out loud)

- **Authority gate** — L1 < L2 < supervisor. Above-limit approvals escalate, never grant.
- **Visibility wall** — claimants never see reserve, notes, assignee, or coverage. DTO-layer, tested.
- **Audit immutability** — append-only log (DB trigger); every decision has actor + rationale.

DEMO CUE • 30 seconds

Open the supervisor Overview: 8 live aggregates. That is the whole book at a glance.

Claimant: file in minutes, track without calling

Report a loss

Tell us what happened and we'll issue a claim number straight away. You'll be able to track the claim from the moment it's filed.

[Your policy](#) [What happened](#)

When the claim is made, we'll assign an adjuster to your claim. You'll be able to track the claim from the moment it's filed.

Policy number: POL-10001 Policyholder name: Policyholder email: john.doe@example.com

Claim received

Your claim number: **CLM-000002**

What happens next

1. FNOL received — your claim is being routed to an adjuster

2. Under review — an adjuster has been assigned to your claim

A confirmation email will be sent to the policyholder address.

[Track this claim](#) [Back to home](#)

Real product screen — left: 2-step FNOL wizard • right: claim number issued instantly

- **Status screen shows steps** — never reserve, notes, assignee, or coverage (wall holds on closed claims too).
- **My claims history** — newest first; decision amount or denial remarks inline.
- **Emails that can't get lost** — FNOL / assignment / decision via outbox with retry (R2).

Claim CLM-000002

[View details](#)

This public record of your claim — this page shows where it stands as it moves through claims.

Progress

1. FNOL received — your claim is being routed to an adjuster

2. Under review — an adjuster has been assigned to your claim

[My claims](#) [Back to home](#)

Real product screen — claimant track screen: process steps, decision only if won

DEMO CUE • file a live FNOL against POL-10001, watch the claim number + Mailpit email.

Adjuster: a queue that works top-down

Real product screen — adjuster.one (L1) queue: own claims, oldest first, server search

Real product screen — claim detail: work surface with decision panel + audit trail

- **Claim detail** — coverage, reserve form, internal notes, photo downloads, decision panel.
- **Reserve is a free estimate** — only the indemnity payment is authority-gated.
- **Above-limit?** — one click escalates to L2 or supervisor. No self-approval, ever.

DEMO CUE • set a reserve, add a note, then approve £1,500 — claim closes + payment recorded.

The authority gate: the moment buyers lean in

Supervisor unlimited

£1,500 as L1 -> APPROVED, payment recorded, CLOSED

L2 <= £10,000

£8,000 as L1 -> ESCALATED to L2 (least-loaded)

L1 <= £2,500

£12,000 / 5 days old -> ESCALATED_SUPERVISOR

Limits live per product code: the next decision uses the new ladder immediately (no cache).

- **Try to break it** — approve £12,000 as L1: blocked, escalated, audit row names you.
- **Aging ladder** — 3 days -> L2, 5 days -> supervisor; claimant sees the escalation.
- **Single-payment atomicity** — decision + payment + closure in one transaction (row-locked).

DEMO CUE • attempt the above-limit approval. The block IS the feature — narrate it.

Supervisor: run the book, prove compliance

Real product screen — overview: 8 live aggregates — the whole book at a glance

- **Policy book** — create + CSV import (per-row errors) + retire. Load a carrier's book live on the call.
- **Email outbox** — every notice PENDING -> SENT, failures retried; prove notification in diligence.
- **Audit trail** — immutable (DB trigger), per-claim view + export for the regulator.

Real product screen — left: escalations waiting on you • right: policy book with CSV import

DEMO CUE • import the 3-row CSV (1 bad row) — the error row is the trust moment.

Engineered to survive diligence

- **182 backend tests green** — gate matrix, wall-shape tests, trigger test, Mailpit delivery pins.
- **15 E2E journeys, hermetic** — own backend :8082 + frontend :4200; boots its own world on any laptop.
- **Migrations V1-V11, append-only** — Flyway checksums load-bearing; V1-V8 never edited.
- **Ops runbook + api.http** — restore-pairing gate, alert table, onboarding checklist, example per endpoint.
- **Infra you already have** — Docker + Postgres + Keycloak + Mailpit. Realm-per-carrier tenancy.
- **No lock-in surprises** — photo-storage interface (S3 path needs no schema change), OIDC-standard auth.

Real product screen — left: authority ladder editor (live, no cache) • right: claimant history

Answer before they ask: 404-not-403 (existence never leaks) • rationale required • closed is terminal
Single-payment atomicity • per-claimant + IP flood guards • request-id tracing with user-safe references

Pilot in weeks, not quarters.

Dedicated realm + database per carrier. Your policies imported on the first call.
Your adjusters working their own queue the same afternoon.

Week 1 — your book, live

Onboarding checklist: realm -> staff -> authority ladder -> CSV import -> demo seed.

Weeks 2-5 — paid pilot

Reopen/appeal, staff roster, notification prefs, audit export, a11y evidence.

After customer two — scale

Tranches, row-level tenancy, SMS, coverage rules — priced roadmap, not surprises.

Next step: name the pilot book. We import it together — live.
